

# Techniques of Water-Resources Investigations of the United States Geological Survey

## Chapter A1

### A MODULAR THREE-DIMENSIONAL FINITE-DIFFERENCE GROUND-WATER FLOW MODEL

By Michael G. McDonald and  
Arlen W. Harbaugh

This chapter supersedes U.S. Geological  
Survey Open-File Report 83-875

Book 6  
MODELING TECHNIQUES

## Narrative for Module SSOR1B

Module SSOR1B uses Gaussian elimination to solve a matrix equation of the form  $[A]\{X\}=\{B\}$ . The matrix  $[A]$  is symmetric and banded with rank "N." It is stored in the compressed format shown in figure 55 and uses a single subscript. The vector  $\{X\}$ , as it is calculated, is stored in the space reserved for vector  $\{B\}$ .

The indices used in the module flow chart are those for standard matrix organization. The indices actually used in the program are based on the compressed format and a single index. Module SSOR1B performs its functions in the following order:

1. Work through the first  $N-1$  rows using each one, in sequence, as the pivot row (row I).

2. Calculate the inverse of the main diagonal element--- $a_{I,I}$ . (The index (ID) points to  $a_{I,I}$  which is the first element of column I in the compressed matrix  $[A]$ .)

3. Modify each of the rows after row I so that the terms corresponding to the pivot term are eliminated. Since the coefficient matrix is banded, there are only MBW-1 equations (where MBW is the maximum half-bandwidth plus one) where the term to be eliminated is not already equal to zero. The rows are indexed by "L." (The equation corresponding to row "L" is referred to as equation "L.")

4. Calculate the coefficient C which when multiplied by the pivot equation and subtracted from equation L will eliminate a term in equation L.

(The index IB points to a coefficient in the pivot equation which, because of symmetry, is equal to the coefficient to be eliminated.)

5. Calculate the new coefficients in equation L for each of the terms to the right of the coefficient that is being eliminated. Because the matrix is banded, there are only MBW-1 nonzero terms to the right of the pivot. Therefore, at most, MBW-1 coefficients have to be calculated.

6. Subtract C times a coefficient in the pivot equation from the corresponding coefficient in equation L.

7. Subtract C times the right side of the pivot equation from the right side of equation L. (The index LB points to the coefficient in equation L which must be calculated.)

8. Solve equation N for X(N) putting the result in B(N).

9. Work backward from equation N-1 solving each equation (equation L) for X(L).

10. Set the accumulator "SUM" equal to zero.

11. Multiply the coefficient to the right of the main diagonal (in equation L) by the corresponding value of X and add it to the sum.

12. Calculate the value of X(L) and store it in B(L).

13. RETURN.

## Flow Chart for Module SSOR1B

MBW is the maximum half bandwidth  
of the coefficient matrix plus one.

### List of Variables for Module SSOR1B

| <u>Variable</u> | <u>Range</u> | <u>Definition</u>   |
|-----------------|--------------|---|
| A               | Package      | DIMENSION (MBW,NSLICE), Compressed coefficient matrix for a slice.                              |
| B               | Package      | DIMENSION (N), Right-hand-side vector.  |
| C               | Module       | Factor needed to eliminate a term in the target row.  |
| C1              | Module       | Inverse of pivot.   |
| I               | Module       | Index for rows in the SSOR matrix (not the grid).   |
| IB              | Module       | Index for elements to the right of the pivot.   |
| ID              | Module       | Index of pivots.  |
| J               | Module       | Index for columns.  |
| K               | Module       | Index for columns.  |
| L               | Module       | Index for equations.  |
| LB              | Module       | Index for elements in the target row to the right of the main diagonal.                         |
| LD              | Module       | Index of the main diagonal elements in the target rows.   |
| MBW             | Package      | Maximum bandwidth of the coefficient matrix +1.   |
| MBW1            | Module       | Maximum bandwidth of the coefficient matrix.  |
| MBW1M           | Module       | Maximum possible number of the nonzero elements to the right of the main diagonal.              |
| N               | Package      | Number of equations to be solved.   |
| NA              | Package      | One-dimension size of compressed matrix "A."  |
| NM1             | Module       | N-1.  |
| SUM             | Module       | In back substitution--in equation L, sum of terms to the right of the main diagonal term (L,L). |

## CHAPTER 14

### UTILITY MODULES

Utility modules are those submodules which perform general tasks common to several different packages. The name of a utility module always consists of a "U" followed by a five-character mnemonic. There are eight utility modules:

|                         |   |
|-------------------------|---|
| UBUDSV                  | Writes an unformatted record consisting of an array with one real number for each cell in the grid.   |
| ULASAV                  | Writes an unformatted record consisting of an array with one real number for each cell in a layer.  |
| ULAPRS<br>and<br>ULAPRW | Prints one two-dimensional array which contains one real number for each cell in a layer.<br>ULAPRS prints, in strip form, the first N columns (where N is the number of values that can fit on one print line) of each row and then the next N columns, etc., until all columns of each row are printed (fig. 56). ULAPRW prints, in wrap form, all of row 1, all of row 2, and all of row 3, etc. The format for printing arrays is shown in table 2. |
| UCOLNO                  | Prints column numbers at the top of each page of data printed by ULAPRS and ULAPRW.   |
| U2DREL                  | Reads a two-dimensional array of real numbers.  |
| U2DINT                  | Reads a two-dimensional array of integers.  |
| U1DREL                  | Reads a one-dimensional array of real numbers.  |

|   | 1       | 2       | 3       | 4       | 5       | 6       | 7       | 8       | 9       | 10      |
|---|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|
|   | 11      | 12      | 13      | 14      | 15      | 16      | 17      |         |         |         |

## Input Instructions For Array Reading Utility Modules

The real two-dimensional array reader (U2DREL), the integer two-dimensional array reader (U2DINT), and the real one-dimensional array reader (U1DREL) read one array-control record and, optionally, a data array in a format specified on the array-control record. The control record is read from the input unit number specified for the major option that is requesting the array. For example, the Recharge Package uses U2DREL to read the RECH array. The input unit for the recharge option is contained in IUNIT (8), and accordingly, the RECH array control record is read on this input unit.

### FOR REAL ARRAY READER (U2DREL or U1DREL)

|         |       |        |       |      |
|---------|-------|--------|-------|------|
| Data:   | LOCAT | CNSTNT | FMTIN | IPRN |
| Format: | I10   | F10.0  | 5A4   | I10  |

### FOR INTEGER ARRAY READER (U2DINT)

|         |       |        |       |      |
|---------|-------|--------|-------|------|
| Data:   | LOCAT | ICONST | FMTIN | IPRN |
| Format: | I10   | I10    | 5A4   | I10  |

#### Explanation of Fields Used in Input Instructions

LOCAT--indicates the location of the data which will be put in the array.

If LOCAT < 0, the sign is reversed to give the unit number from which an unformatted record will be read.

If LOCAT = 0, every element in the array will be set equal to the value CNSTNT/ICONST.

If LOCAT > 0, it is the unit number from which data values will be read in the format specified in the third field of the array-control record (FMTIN).

CNSTNT/ICONST--is a constant. Its use depends on the value of LOCAT.

If LOCAT = 0, every element in the array is set equal to CNSTNT/ICONST.

If LOCAT ≠ 0, and if CNSTNT/ICONST ≠ 0, every element in the array is multiplied by CNSTNT/ICONST.

FMTIN--is the format of records containing the array values. It is used only if the first field in the array-control record (LOCAT) contains a positive number. The format must be enclosed in parentheses; for example, (15F5.0) for real data and (15I5) for integer data.

IPRN--is a flag indicating that the array being read should be printed and a code for indicating the format that should be used. It is used only if LOCAT is not equal to zero. The format codes are different for each of the three modules. IPRN is set to zero when the specified value exceeds those defined in the chart below. If IPRN is less than zero, the array will not be printed.

| <u>IPRN</u> | <u>U2DREL</u> | <u>U2DINT</u> | <u>U1DREL</u> |
|-------------|---------------|---------------|---------------|
| 0           | 10G11.4       | 10I11         | 10G12.5       |
| 1           | 11G10.3       | 60I1          |               |
| 2           | 9G13.6        | 40I2          |               |
| 3           | 15F7.1        | 30I3          |               |
| 4           | 15F7.2        | 25I4          |               |
| 5           | 15F7.3        | 20I5          |               |
| 6           | 15F7.4        |               |               |
| 7           | 20F5.0        |               |               |
| 8           | 20F5.1        |               |               |

### Narrative for Module UBUDSV

Utility module UBUDSV writes an unformatted record consisting of an array dimensioned (NCOL, NROW, NLAY). The record containing the array is preceded by an unformatted record containing identifying information. The identifying information consists of:

|      |                       |                  |         |
|------|-----------------------|------------------|---------|
| KSTP | current time step     | integer          | 1 word  |
| KPER | current stress period | integer          | 1 word  |
| TEXT | label                 | character string | 4 words |
| NCOL | number of columns     | integer          | 1 word  |
| NROW | number of rows        | integer          | 1 word  |
| NLAY | number of layers      | integer          | 1 word  |

Documentation of this module consists only of comments in the program and a list of variables.

### Narrative for Module ULAPRS

Module ULAPRS prints a two-dimensional array in strip form (fig. 56) using one of twelve FORTRAN formats. Module ULAPRS performs its tasks in the following order:

1. Get the format code (IP). If it is less than 1 or greater than 12, set it equal to 12 (the default).
2. Use the format code (IP) to determine the number of values (NCAP) to be printed on one line.
3. Calculate the number of spaces used for each value (NCPF) and the number of strips (NSTRIP). Initialize the fields to store the first column (J1) and the last column (J2) for each strip.
4. Loop through the strips (DO STEPS 5-8).
5. Calculate the first (J1) and last (J2) column for this strip.
6. Print a title on each strip.
7. Call module UCOLNO to print the column numbers above each strip.
8. Loop through the rows printing columns J1 through J2 using the appropriate format (IP).
9. RETURN.

## Flow Chart for Module ULAPRS

IPRN is a code indicating the format to be used in printing array values. If it is not between 1 and 12, it is set equal to 12.
